

3.3 V ECL Programmable Delay Chip MC100EP195B

Descriptions

The MC100EP195B is a Programmable Delay Chip (PDC) designed primarily for clock deskewing and timing adjustment. It provides variable delay of a differential NECL/PECL input transition.

The delay section consists of a programmable matrix of gates and multiplexers as shown in the logic diagram, Figure 2. The delay increment of the EP195B has a digitally selectable resolution of about 10 ps and a net range of up to 10.2 ns. The required delay is selected by the 10 data select inputs D[9:0] values and controlled by the LEN (pin 10). A LOW level on LEN allows a transparent LOAD mode of real time delay values by D[9:0]. A LOW to HIGH transition on LEN will LOCK and HOLD current values present against any subsequent changes in D[10:0]. The approximate delay values for varying tap numbers correlating to D0 (LSB) through D9 (MSB) are shown in Table 6 and Figure 3.

The $\overline{\text{IN}}/\overline{\text{IN}}$ inputs can accept LVPECL (SE of Diff), or LVDS level signals. Because the EP195B is designed using a chain of multiplexers it has a fixed minimum delay of 2.2 ns. An additional pin D10 is provided for controlling Pins 14 and 15, CASCADE and $\overline{\text{CASCADE}}$, also latched by LEN, in cascading multiple PDCs for increased programmable range. The cascade logic allows full control of multiple PDCs. Switching devices from all “1” states on D[0:9] with SETMAX LOW to all “0” states on D[0:9] with SETMAX HIGH will increase the delay equivalent to “D0”, the minimum increment.

Select input pins D[10:0] may be threshold controlled by combinations of interconnects between V_{EF} (pin 7) and V_{CF} (pin 8) for LVCMOS, ECL, or LVTTTL level signals. For LVCMOS input levels, leave V_{CF} and V_{EF} open. For ECL operation, short V_{CF} and V_{EF} (Pins 7 and 8). For LVTTTL level operation, connect a 1.5 V supply reference to V_{CF} and leave open V_{EF} pin. The 1.5 V reference voltage to V_{CF} pin can be accomplished by placing a 2.2 k Ω resistor between V_{CF} and V_{EE} for a 3.3 V power supply.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single-ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

The 100 Series contains temperature compensation.

Features

- Maximum Input Clock Frequency >1.2 GHz Typical
- Programmable Range: 0 ns to 10 ns
- Delay Range: 2.2 ns to 12.2 ns
- 10 ps Increments
- PECL Mode Operating Range:
 $V_{\text{CC}} = 3.0 \text{ V to } 3.6 \text{ V with } V_{\text{EE}} = 0 \text{ V}$
- NECL Mode Operating Range:
 $V_{\text{CC}} = 0 \text{ V with } V_{\text{EE}} = -3.0 \text{ V to } -3.6 \text{ V}$

- $\overline{\text{IN}}/\overline{\text{IN}}$ Inputs Accept LVPECL, LVNECL, LVDS Levels
- A Logic High on the $\overline{\text{EN}}$ Pin Will Force Q to Logic Low
- D[10:0] Can Select Either LVPECL, LVCMOS, or LVTTTL Input Levels
- These are Pb-Free Devices
- V_{BB} Output Reference Voltage

Table 1. PIN DESCRIPTION

Pin	Name	I/O	Default State	Description
23, 25, 26, 27, 29, 30, 31, 32, 1, 2	D[0:9]	LVC MOS, LV TTL, ECL Input	Low	Single-Ended Parallel Data Inputs [0:9]. Internal 75 k Ω to V _{EE} . (Note 1)
3	D[10]	LVC MOS, LV TTL, ECL Input	Low	Single-Ended CASCADE/CASCADE Control Input. Internal 75 k Ω to V _{EE} . (Note 1)
4	IN	LVPECL, LVDS	Low	Noninverted Differential Input. Internal 75 k Ω to V _{EE} .
5	$\overline{\text{IN}}$	LVPECL, LVDS	High	Inverted Differential Input. Internal 75 k Ω to V _{EE} and 36.5 k Ω to V _{CC} .
6	V _{BB}	–	–	ECL Reference Voltage Output
7	V _{EF}	–	–	Reference Voltage for ECL Mode Connection
8	V _{CF}	–	–	LVC MOS, ECL, OR LV TTL Input Mode Select
9, 24, 28	V _{EE}	–	–	Negative Supply Voltage. All V _{EE} Pins must be Externally Connected to Power Supply to Guarantee Proper Operation. (Note 2)
13, 18, 19, 22	V _{CC}	–	–	Positive Supply Voltage. All V _{CC} Pins must be externally Connected to Power Supply to Guarantee Proper Operation. (Note 2)
10	LEN	ECL Input	Low	Single-ended D pins LOAD / HOLD input. Internal 75 k Ω to V _{EE} .
11	SETMIN	ECL Input	Low	Single-ended Minimum Delay Set Logic Input. Internal 75 k Ω to V _{EE} . (Note 1)
12	SETMAX	ECL Input	Low	Single-ended Maximum Delay Set Logic Input. Internal 75 k Ω to V _{EE} . (Note 1)
14	$\overline{\text{CASCADE}}$	ECL Output	–	Inverted Differential Cascade Output for D[10]. Typically Terminated with 50 Ω to V _{TT} = V _{CC} – 2 V.
15	CASCADE	ECL Output	–	Noninverted Differential Cascade Output. for D[10] Typically Terminated with 50 Ω to V _{TT} = V _{CC} – 2 V.
16	$\overline{\text{EN}}$	ECL Input	Low	Single-ended Output Enable Pin. Internal 75 k Ω to V _{EE} .
17	NC	–	–	No Connect. The NC Pin is Electrically Connected to the Die and "MUST BE" Left Open
21	Q	ECL Output	–	Noninverted Differential Output. Typically Terminated with 50 Ω to V _{TT} = V _{CC} – 2 V.
20	$\overline{\text{Q}}$	ECL Output	–	Inverted Differential Output. Typically Terminated with 50 Ω to V _{TT} = V _{CC} – 2 V.

1. SETMIN will override SETMAX if both are high. SETMAX and SETMIN will override all D[0:10] inputs.
2. All V_{CC} and V_{EE} pins must be externally connected to Power Supply to guarantee proper operation.

Table 2. CONTROL PIN

Pin	State	Function
EN	LOW (Note 3)	Input Signal is Propagated to the Output
	HIGH	Output Holds Logic Low State
LEN	LOW (Note 3)	Transparent or LOAD mode for real time delay values present on D[0:10].
	HIGH	LOCK and HOLD mode for delay values on D[0:10]; further changes on D[0:10] are not recognized and do not affect delay.
SETMIN	LOW (Note 3)	Output Delay set by D[0:10]
	HIGH	Set Minimum Output Delay
SETMAX	LOW (Note 3)	Output Delay set by D[0:10]
	HIGH	Set Maximum Output Delay
D10	LOW (Note 3)	CASCADE Output LOW, CASCADE Output HIGH
	HIGH	CASCADE Output LOW, CASCADE Output HIGH

3. Internal pulldown resistor will provide a logic LOW if pin is left unconnected.

Table 3. CONTROL D[0:10] INTERFACE

V_{CF}	V_{EF} Pin (Note 4)	ECL Mode
V_{CF}	No Connect	LVC MOS Mode
V_{CF}	1.5 V $\pm$ 100 mV	LVTTL Mode (Note 5)

4. Short V_{CF} (pin 8) and V_{EF} (pin 7).

5. When Operating in LVTTL Mode, the reference voltage can be provided by connecting an external resistor, R_{CF} (suggested resistor value is 2.2 k Ω $\pm$ 5%), between V_{CF} and V_{EE} pins.

Table 4. DATA INPUT ALLOWED OPERATING VOLTAGE MODE TABLE

POWER SUPPLY	CONTROL DATA SELECT INPUTS PINS (D [0:10])			
	LVC MOS	LVTTL	LVPECL	LVNECL
PECL Mode Operating Range	YES	YES	YES	N/A
NECL Mode Operating Range	N/A	N/A	N/A	YES

Table 5. ATTRIBUTES

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

14. Measured using a 750 mV source, 50% duty cycle clock source. All loading with 50 Ω to $V_{CC} - 2.0\text{ V}$.

15. Specification limits represent the amount of delay added with the assertion of each individual delay control pin. The various combinations of asserted delay control inputs will typically realize D0 resolution steps across the specified programmable range.

16. Duty cycle skew guaranteed only for differential operation measured from the cross point of the input to the cross point of the output.

17. This setup time defines the amount of time prior to the input signal the delay tap of the device must be set.

18. This setup time is the minimum time that EN must be asserted prior to the next transition of IN/IN to prevent an output response greater than $\pm 75\text{ mV}$ to that IN/IN transition.

19. This hold time is the minimum time that EN must remain asserted after a negative going IN or positive going IN to prevent an output response greater than $\pm 75\text{ mV}$ to that IN/IN transition.

20. This release time is the minimum time that EN must be deasserted prior to the next IN/IN transition to ensure an output response that meets the specified IN to Q propagation delay and transition times.

21. Deviation from a linear delay (actual Min to Max) in the 1024 programmable steps.

	20–80% (CASCADE)	110	160	210	120	175	230	120	190	250	

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm.

14. Measured using a 750 mV source, 50% duty cycle clock source. All loading with $50\ \Omega$ to $V_{CC} - 2.0\text{ V}$.

15. Specification limits represent the amount of delay added with the assertion of each individual delay control pin. The various combinations of asserted delay control inputs will typically realize D0 resolution steps across the specified programmable range.

16. Duty cycle skew guaranteed only for differential operation measured from the cross point of the input to the cross point of the output.

17. This setup time defines the amount of time prior to the input signal the delay tap of the device must be set.

18. This setup time is the minimum time that $\overline{EN}$ must be asserted prior to the next transition of IN/ $\overline{IN}$ to prevent an output response greater than $\pm 75\text{ mV}$ to that IN/ $\overline{IN}$ transition.

19. This hold time is the minimum time that $\overline{EN}$ must remain asserted after a negative going IN or positive going $\overline{IN}$ to prevent an output response greater than $\pm 75\text{ mV}$ to that IN/ $\overline{IN}$ transition.

20. This release time is the minimum time that $\overline{EN}$ must be deasserted prior to the next IN/ $\overline{IN}$ transition to ensure an output response that meets the specified IN to Q propagation delay and transition times.

21. Deviation from a linear delay (actual Min to Max) in the 1024 programmable steps.

MC100EP195B

Figure 4. AC Reference Measurement

Cascading Multiple EP195Bs

To increase the programmable range of the EP195B, internal cascade circuitry has been included. This circuitry allows for the cascading of multiple EP195Bs without the need for any external gating. Furthermore, this capability requires only one more address line per added E195B. Obviously, cascading multiple programmable delay chips will result in a larger programmable range: however, this increase is at the expense of a longer minimum delay.

Figure 5 illustrates the interconnect scheme for cascading two EP195Bs. As can be seen, this scheme can easily be

expanded for larger EP195B chains. The D10 input of the EP195B is the CASCADE control pin. With the interconnect scheme of Figure 5 when D10 is asserted, it signals the need for a larger programmable range than is achievable with a single device and switches output pin CASCADE HIGH and pin $\overline{\text{CASCADE}}$ LOW. The A11 address can be added to generate a cascade output for the next EP195B. For a 2-device configuration, A11 is not required.

Figure 5. Cascading Interconnect Architecture

An expansion of the latch section of the block diagram is pictured in Figure 6. Use of this diagram will simplify the explanation of how the cascade circuitry works. When D10 of chip #1 in Figure 5 is LOW this device's CASCADE output will also be low while the CASCADE output will be high. In this condition the SET MIN pin of chip #2 will be asserted HIGH and thus all of the latches of

chip #2 will be reset and the device will be set at its minimum delay.

Chip #1, on the other hand, will have both SET MIN and SET MAX deasserted so that its delay will be controlled entirely by the address bus A0—A9. If the delay needed is greater than can be achieved with 1023 gate delays (1111111111 on the A0—A9 address bus) D10 will be

MC100EP195B

asserted to signal the need to cascade the delay to the next EP195B device. When D10 is asserted, the SET MIN pin of chip #2 will be deasserted and SET MAX pin asserted resulting in the device delay to be the maximum delay. Table 11 shows the delay time of two EP195B chips in cascade.

To expand this cascading scheme to more devices, one simply needs to connect the D10 pin from the next chip to the address bus and CASCADE outputs to the next chip in the same manner as pictured in Figure 5. The only addition to the logic is the increase of one line to the address bus for cascade control of the second programmable delay chip.

Multi-Channel Deskewing

The most practical application for EP195B is in multiple channel delay matching. Slight differences in impedance and cable length can create large timing skews within a high-speed system. To deskew multiple signal channels, each channel can

be sent through each EP195B as shown in Figure 7. One signal channel can be used as reference and the other EP195Bs can be used to adjust the delay to eliminate the timing skews. Nearly any high-speed system can be fine-tuned (as small as 10 ps) to reduce the skew to extremely tight tolerances.

Figure 7. Multiple Channel Deskewing Diagram

Measure Unknown High Speed Device Delays

EP195Bs provide a possible solution to measure the unknown delay of a device with a high degree of precision. By combining two EP195Bs and EP31 as shown in Figure 8, the delay can be measured. The first EP195B can be set to SETMIN and its output is used to drive the unknown delay device, which in turn drives the input of a D flip-flop of EP31. The second EP195B is triggered along with the first EP195B and its output provides a clock signal for EP31. The programmed delay of the second EP195B is varied to detect the output edge from the unknown delay device.

If the programmed delay through the second EP195B is too long, the flip-flop output will be at logic high. On the other hand, if the programmed delay through the second EP195B is too short, the flip-flop output will be at a logic low. If the programmed delay is correctly fine-tuned in the second EP195B, the flip-flop will bounce between logic high and logic low. The digital code in the second EP195B can be directly correlated into an accurate device delay.
